#### Assignment 4

1. Consider a relation  $R(A, B, C, D, E)$  with

$FD = \{AB \rightarrow C, CD \rightarrow E, C \rightarrow A, C \rightarrow D, D \rightarrow B\}$

Scratch work:

$AB \rightarrow \{ABCDE\}$

$AC \rightarrow \{ABCDE\}$  (redundant because of C)

$CD \rightarrow \{ABCDE\}$  (redundant because of C)

$AD \rightarrow \{ABCDE\}$

$C \rightarrow \{ABCDE\}$

$D \rightarrow \{BD\}$

$E \rightarrow \{E\}$

**Keys:**

$AB \rightarrow \{ABCDE\}$

$AD \rightarrow \{ABCDE\}$

$C \rightarrow \{ABDCE\}$

2. Consider a relation schema  $R(A, B, C, D, E, F)$  with

$FD = \{AB \rightarrow C, AD \rightarrow B, C \rightarrow B, F \rightarrow AD, F \rightarrow E\}$

- a. Use Armstrong's Axioms to prove  $F$  is a superkey of  $R$ .

$F \rightarrow \{F\}$  (Reflexivity)

$F \rightarrow \{ADF\}$  ( $F \rightarrow AD$ ) (given)

$F \rightarrow \{ADEF\}$  ( $F \rightarrow E$ ) (given)

$F \rightarrow \{ABDEF\}$  ( $AD \rightarrow B$ ) (Transitive)

$F \rightarrow \{ABCDEF\}$  ( $F \rightarrow A$  &  $F \rightarrow B$  because of Decomposition) ( $AB \rightarrow C$ )  
(Transitive)

**$F$  is a superkey of  $R$ .**

- b. Construct a BCNF decomposition of  $R$ .

- i. Find candidate keys.

Left	Middle	Right
$F$	$A, B, C, D$	$E$

**$F$  is a superkey alone.**

- ii. Decompose the ones that are not a superkey.

$AB \rightarrow C$ ,  $AD \rightarrow B$ , and  $C \rightarrow B$  are all violations. We try to pull them out from  $ABCDEF$ .

This leaves us with  $BC$  and  $ACDEF$ .

iii. Is this lossless?

BC intersect ACDEF yields us C, which by the given FD ( $C \rightarrow B$ ) can give us BC back, proves that this BCNF decomposition is lossless, as all BCNF decompositions are by definition.

iv. Is this dependency preserving?

If there exists a given FD that cannot be performed in the decomposed tables without joining them, the decomposition is not dependency preserving. One given FD is ( $AB \rightarrow C$ ). BC cannot do this, as A is not one of its members. ACDEF cannot do this, as B is not one of its members. Without joining these tables, we are unable to preserve this dependency. As such, this BCNF decomposition is lossless, but not dependency preserving.

c. Produce a lossless, dependency preserving 3NF decomposition for R.

i. Find the minimal cover for R.

Minimize the right side:  $F' = \{F \rightarrow A, F \rightarrow D, F \rightarrow E, AB \rightarrow C, C \rightarrow B, AD \rightarrow B\}$

The left side cannot be further minimized. None of these FDs are redundant, as such  $F'$  is our minimal cover for R.

ii. BCNF Decomposition

We decompose into BC and ACDEF.  $D = \{BC, ACDEF\}$

iii. Identify dependencies N in  $F'$  not preserved

$N = \{AB \rightarrow C, AD \rightarrow B\}$

iv. For each  $X \rightarrow A$  in N, create a relation schema XA and add it to D

$D = \{BC, ACDEF, ABC, ADB\}$

With step iv complete, D is now a lossless, dependency preserving 3NF decomposition of scheme R.
